② Fuel path diagram

- a) Fuel oil in the fuel tank is sucked by the feed pump built in the pump through the fuel filter (with a built-in water separator which is located at the bottom) and sent to the fuel inlet of the fuel injection pump.
- b) There is an air breathe bolt on the side of the priming pump, and a sensor for detecting collected water at the bottom of the fuel filter.
- c) The fuel oil sent to the fuel inlet is pressurized by the feed pump and supplied to the pump chamber. The pressure of the fuel in the pump chamber is proportional to the pump speed. However, if the specified pressure is exceeded, the regulating valve will return excessive fuel to the suction side.
- d) The fuel in the pump chamber is sent to the plunger through the fuel passage located in the distributor head. The pressure of the fuel is then increased by the plunger and the fuel is sent to the nozzle holder under pressure through the fuel injection pipe.
- e) The overflow valve located on the top of the pump holds the fuel oil pressure in the pump chamber constant and returns excessive fuel to the fuel tank.
